Medical Doctor, Researcher, Strategic Medical Intelligence

2. THE CHALLENGE**Challenge title**

How can we build the next generation hospital-at-home?

Background & context

Healthcare systems are facing increasing demand, long waiting times and limited resources. At the same time, many patients could potentially receive some — or even all — of their care at home, if the right conditions were in place. World wide treating patients at home, so called hospital-at-home, is a transformative movement in healthcare.

Core question for builders

How can we enable more patients to receive safe, effective and accessible care at home? If all hospital were to close tomorrow - how could your innovation help patients to receive the same (or better) care at home?

3A. SCOPE — WHAT IS IN SCOPE**Focus areas / user groups / topics teams should explore**

- Patient journeys and care situations that could be moved partly or fully into the home
- Digital tools, AI, remote monitoring and diagnostics
- Communication and collaboration between patients, caregivers and healthcare providers
- New services, workflows and ways of organising care
- Logistics, equipment and infrastructure enabling home-based care
- Different patient needs and levels of digital access
- Solutions that improve patient safety, accessibility, quality and healthcare capacity

3B. SCOPE — WHAT IS OUT OF SCOPE**Legal, technical, or strategic constraints to be aware of**

- Solutions that compromise **patient safety, privacy, ethics or equal access**
- Concepts that require changes to **laws or regulations** that are not realistically achievable
- Replacing healthcare professionals entirely rather than **supporting and augmenting their work**
- Solutions focused solely on **digitalisation without addressing a real patient or healthcare need**
- Ideas that shift care to the home without considering **patient capability, support needs and responsibility for care**

4. WHAT A GREAT SOLUTION LOOKS LIKE

Success criteria

- Addresses a **real and clearly defined healthcare need**
- Creates meaningful value for **patients and/or healthcare professionals**
- Improves **safety, accessibility, quality or efficiency** of care
- Is **feasible and scalable** within the healthcare system
- Considers **privacy, ethics and equal access**
- Clearly explains **how the solution could work in practice**
- Shows a credible **first step towards testing or implementation**

Deliverable expected

Concept + prototype/mock-up + short pitch, showing the problem, proposed solution, value created, and how it could work in practice.

Format preference

Short slide deck + prototype/mock-up or visualisation + 3-minute pitch

5. SUPPORT YOU CAN OFFER TO TEAMS

Data & materials provided
